Excuse the long delay - completely unforgivable, dear Mona, but I still beg your indulgence. As a pensioner, I don't have time to do as much anymore. Anyway, here are my answers to your questions:

1) Vidar Skipenes. I don't remember what date this was. --- This study is easy to repeat, contact an appropriate department at a university hospital; However, make sure that everything is done under strictly controlled conditions as well as under double-blind coding; enrol a haematopathologist specializing in blood/bone marrow/Rouleaux assays under a microscope. ---We were not able to replicate the findings that had been shown in videos on the Internet.

2) Mak P, Johansson O, van Wersch A, Huebner S, "No effect of mobile phone exposure on average erythrocyte aggregation as viewed in dark-field microscopy, with or without a "mobileFloww" device. A double-blind pilot study," Teesside University, Sept. 22, 2016. While this study is easy to repeat, make sure that everything is done under strictly controlled conditions as well as under double-blind coding. ---We were not able to replicate the findings that had been shown in videos on the Internet.

3) Department of Histology; I don't remember when I did, but I started teaching in 1973 (VT), and continued until approx. 2012. --- I still possess the knowledge of promyelocytes, fat cells, stromal cells, megakaryocytes, neutrophils, eosinophils and basophilic granulocytes, erythrocytes, platelets, small, medium and large lymphocytes, plasmoblasts and plasma cells, monocytes, etc.

4) Don't remember. You can also easily redo this; I contacted hematology centers or hematology departments in Scandinavia, Europe, Canada, USA, etc., by phone. (It would be very exciting if you get a different result! But at the same time a bit strange considering that no academically sound scientist, or any hematology centers/hematology departments, report such changes as I asked about...)

5) Don't remember. You can also easily redo this; I contacted hematology centers or hematology departments in Scandinavia, Europe, Canada, USA, etc., by phone. (It would be very exciting if you get a different result! But at the same time a bit strange considering that no academically sound scientist, or any hematology centers/hematology departments, report such changes as I asked about...)

6) Don't remember. You can also easily redo this; I contacted cardiology and clinical physiology hospital departments in Scandinavia, Europe, Canada, USA, etc., by phone. (It would be very exciting if you get a different result! But at the same time a bit strange considering that no academically sound scientist / - woman, or no cardiological/clinically physiological hospital wards, report such changes as I asked about...)

7) Vidar Skipenes (and with the practical help of Sissel Halmøy, Norway); ca. 25 test subjects were used, several of them under different forms of load. Conventional orthostatic test was used as a positive control (it worked in 100% of the trials). --- While this study is easy to repeat, make sure that everything is done under strictly controlled conditions as well as under double-blind coding. ---We couldn't replicate Magda Havas' findings. ---No specific money was given to this project, as far as I can remember.

8) When I left Karolinska Institutet, this went in the garbage; I had to get rid of approx. 3-4 tons (!) of partly unique archival material, and all of - as I judged - less weight and value had to go into the paper recycling. This simple study you can also easily repeat; I suspect that today - and especially after the COVID-19 pandemic - there will be even more people who want "more, bigger, faster, more powerful, quicker a cell phone system", and also "5G-enabled".

GOOD LUCK!

Best regards, friend Olle

Hello

The studies are presented on our website [stralskyddsstiftelsen.se](https://stralskyddsstiftelsen.se) under the menu "our research". I would also like to take this opportunity to remind you of the urgent questions I asked 2 years ago about alleged investigations that were never reported. These questions asked on August 21, 2021 remain unanswered. See appendix

Sincerely,  
Mona Nilsson
